

Investment-dial V2 — why the coarse grid failed, and what the fine grid recovered (Qwen3.5-4B, layer 15 / neuron 8490)

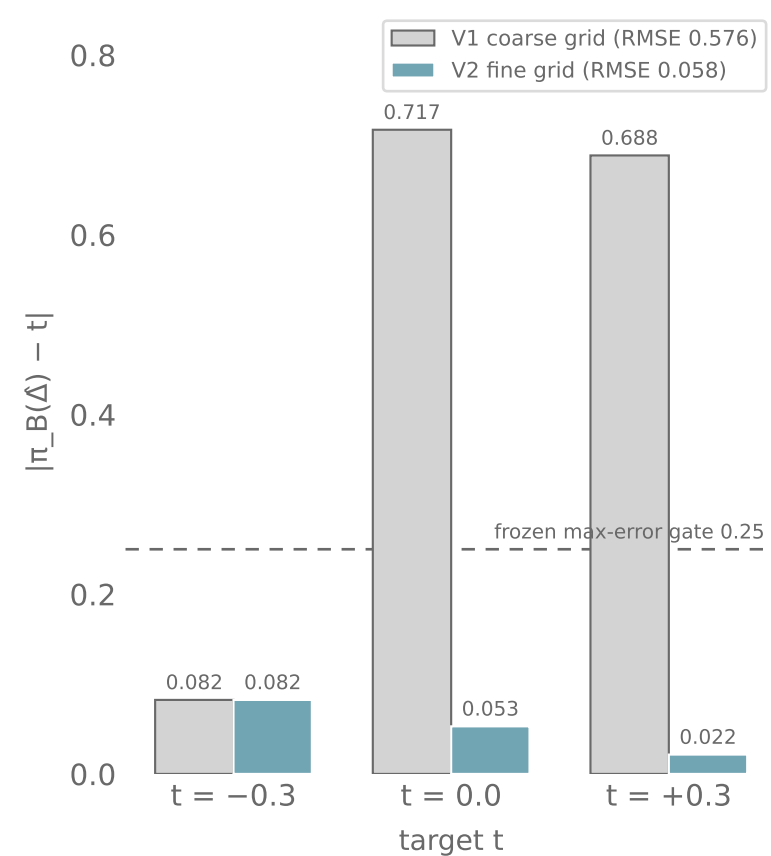

(a) V1's five A samples vs the true curve

(b) V2 resolution: three targets land within 0.083

(c) per-target error: V1 vs V2

Same coordinate, same B population; only the A grid changed: RMSE 0.576 $\rightarrow$ 0.058 (gate pass). A $\rightarrow$ B offset at $\delta=0$: +0.829. B is the V1 transfer set (reevaluation, not fresh holdout).
